

## Flame-X Flame Retardant

### Non-durable Fabric Treatment Certificate of Conformance

PN550 1L and PN545 5L are produced in the UK to meet the requirements of a Non-durable Flame Retardant Treatment for Natural Fabrics. Proper treatment ensures that material will meet the requirements of "Flammability of textile fabrics when subjected to a small igniting flame applied to the face or the bottom edge of vertically oriented specimens" testing.

The holder of this Certificate confirms that they have used Flame-X in accordance with the instructions and that:

- the user hereby confirms that the product was used neat and had not been diluted.
- the method of application was by dipping (preferred for uniform treatment) or by brushing or spraying.
- if sprayed, the fabric was treated uniformly on both sides and allowed to air dry (min 6 hours).
- the user confirms that they have tested a small treated fragment of fabric with a small flame (a match for example) for 2 seconds to confirm treatment has bonded and that no significant holes or gross charring appeared.
- the user confirms that they are aware that if the treated fabric is washed in a detergent solution the treatment will leach away and the treatment will need to be re-applied.
- the user confirms that they are aware that if the treated fabric is dry cleaned the treatment will need to be re-applied.

By signature of this certificate, the customer declares that they have followed the guidelines, treatment, care and testing method of the fabrics treated and that no flare or prolonged flame ensured when subjected to a domestic lit match for two seconds.
